

The Day Cycle

A method of transforming waste into near zero emissions energy, BioFuels and Oxygen.

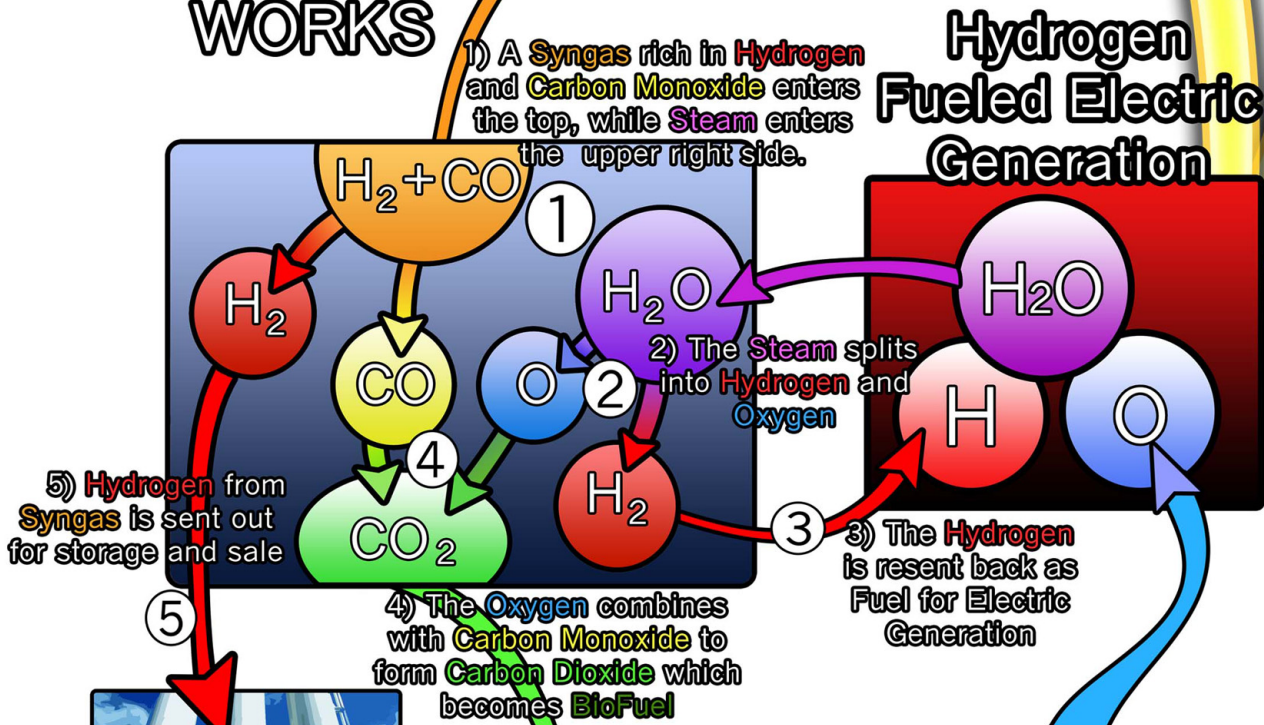

Waste is an underused resource that could be used as an asset

Plasma gasifiers convert feedstocks into a Syngas of Hydrogen and Carbon Monoxide, which is a clean fuel.

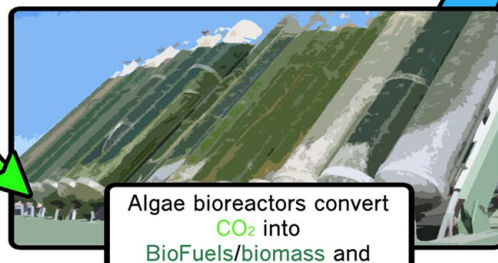

HOW OUR WATER SHIFT REACTOR WORKS

Hydrogen Fueled Electric Generation

Hydrogen storage for export and sale

Algae bioreactors convert CO₂ into BioFuels/biomass and release excess Oxygen

What was waste is now returning as Hydrogen, BioFuels and Oxygen.
